EDUCATION

The Chinese University of Hong Kong	MSc in Artificial Intelligence	08/2026–01/2028
Sun Yat-sen University	BSc in Computer Science and Technology	09/2022–07/2026

PROJECT

PPT Agent *Go, SQLite, React, TypeScript* 07/2026–Present
A harness project for creating and refining HTML slides through natural-language interaction.

- Designed a custom agent harness with domain-specific tools, system prompts, and a command system, integrating multiple model providers.
- Implemented HITL approvals and persistent checkpoints for controlled execution and interruption recovery, with project and session isolation to keep task contexts separate.
- Integrated live HTML previews, Playwright screenshots, and DOM-based element selection to provide visual feedback and support targeted slide editing.

QA Agent *LangChain4j, RAG, PostgreSQL* 03/2026–05/2026
An AI-assisted platform for personalized technical interview preparation and training.

- Designed LangChain4j workflows with explicit node responsibilities, execution dependencies, and structured I/O contracts; added output repair, retries, and fallbacks to handle invalid responses and execution failures.
- Built a RAG pipeline to chunk, store, and index Markdown documents, combining retrieval and reranking to ground question generation in relevant and traceable source material.
- Implemented exam-style interview practice with immediate evaluation and real-time feedback, retaining answer histories to visualize performance metrics and track progress.

Mini Agent *Spring AI, MCP, Vue* 12/2025–02/2026
A workspace for creating, sharing, and reusing task-specific agents.

- Developed an agent execution engine supporting loop, step, and ReAct workflows with multi-role coordination.
- Built pluggable MCP servers for Amap queries, WeCom notifications, and CSDN publishing, with authentication propagation and credential isolation.
- Designed a snapshot mechanism for converting between agent configurations and templates, enabling agent sharing and reuse.

Lucky Draw *Spring Boot, MySQL, Redis, RabbitMQ, ZooKeeper* 10/2025–11/2025
A configurable lottery system for marketing campaigns.

- Designed a unique engine using the Chain of Responsibility pattern for eligibility checks, prize allocation and fallback decisions, enabling flexible rule composition.
- Built a dynamic configuration center supporting hot updates to fallback policies, rate limits, circuit-breaker settings, and operational thresholds.
- Implemented concurrent processing with atomic Redis stock reservations, asynchronous RabbitMQ messaging, transactional persistence, table sharding and scheduled retries for eventual consistency.

INTERNSHIP

ByteDance Ltd.

Backend Developer

06/2026–09/2026

Contributed to an AI-assisted platform for live-stream PK matchmaking, connecting Lark, Rena Agent, and Match Plaza.

- Automated lead capture from group messages, opponent recommendations, and match-intent delivery through interactive cards, increasing Rena adoption from 20% to 80% and improving lead creation efficiency by 60%.
- Authored three agent skills with explicit constraints and HITL checkpoints to guide request parsing, validation, confirmation, execution, and reporting.
- Implemented batch match creation with Saga-style compensation, idempotent operations, and bounded concurrency; isolated per-match failures and used exponential backoff with jitter to handle throttling.

Lianyi Technology Co., Ltd.

Backend Developer

08/2025–10/2025

Contributed to a campus messaging platform supporting asynchronous and reliable delivery.

- Implemented asynchronous message delivery with Kafka, routing messages by channel and department, with support for scheduled delivery, status tracking, dead-letter handling, and real-time alerts via WebSocket.
- Developed a pre-send validation pipeline using custom annotations and AOP to screen sensitive terms, validate recipient details, and check content formats.
- Unified WeCom application messaging APIs for text, card, and image messages, standardizing preprocessing and field mapping for senders, recipients, and message content.

SKILLS

English: IELTS 7.0

Programming Languages: Go, Java, Python, SQL, JavaScript

Infrastructure & Middleware: MySQL, PostgreSQL, SQLite, Redis, RabbitMQ, Kafka, Git, Docker, Linux

Relevant Coursework: Machine Learning, Artificial Intelligence, Computer Network, Operating System, Data Structures

PERSONAL STATEMENT

I am an enthusiastic developer who values rigorous understanding, knowledge sharing, and practical impact. I enjoy using notes and diagrams to clarify complex concepts and share what I learn. I also have practical experience with AI tools and a solid understanding of the principles behind them. I hold my work to high standards of technical quality, usability, and visual design.

With a strong academic foundation in computer science and programming, I have spent the past two years expanding my engineering skills through self-directed learning and hands-on development. To date, I have independently built business applications and AI assistant systems, which have drawn me toward agent harness engineering—particularly system design, execution optimization, and trace evaluation.

My long-term goal is to become a full-stack engineer who combines product judgment with technical depth to build useful, reliable, and well-designed applications.
